

# GENERATIVE AI GROUP GUIDELINES

July 2024

## GENERATIVE AI & OUR RESPONSIBILITY

Generative AI is a subset of artificial intelligence (AI) that focuses on generating new content, such as text, image, and music, through user prompting and context-setting and by learning patterns and structures from large datasets.

At Capgemini, we recognize the potential of generative AI in enhancing various aspects of our internal work along with client projects, from improving customer experiences to optimizing business processes. However, it's essential to approach the use of generative AI with caution and responsibility. While generative AI offers exciting opportunities, it also poses ethical, legal, security and regulatory challenges that must be carefully addressed. Bear in mind this technology is not mature for all types of use cases and it is therefore important to know on which use cases it shows issues of trustworthiness and stable performance.

These guidelines emphasize responsible use, viewing generative AI as a complement to human expertise. By navigating its complexities with care and diligence, we aim to harness the power of generative AI effectively while mitigating associated risks.

### SCOPE OF THESE GUIDELINES

These guidelines are aimed at **all employees inside Capgemini and its subcontractors<sup>1</sup>**. The focus of these guidelines is primarily on safely utilizing Gen AI.

When you use a Gen AI technology, you must **also refer to technology-specific guidelines** released for each Gen AI technology approved at Group level (you can access those guidelines within the process to access Gen AI technologies, see "*Access to Gen AI technologies*" chapter below). These technology-specific guidelines apply on Capgemini environment. Any use of Gen AI technology should always abide by Capgemini's usual Legal, Ethics, Cybersecurity and Data Protection policies and processes.

On Clients' environment: Client's guidelines apply. If ethical or privacy issues, please refer to your management.

### BUSINESS OPPORTUNITIES

For Capgemini, generative AI presents opportunities to enrich our portfolio and transform our internal ways of working. With new tools, updated business models and ideas emerging constantly there is a whirlwind of innovation. However, within this dynamic landscape, there remains a considerable level of uncertainty regarding the optimal utilization of generative AI.

Capgemini has developed a [generative AI Portfolio of services](#), spanning from strategy definition through to practical development and implementation of generative AI at scale.

At Capgemini, we consider exploring Gen AI to enhance productivity and effectiveness. We explore integrating Gen AI to enhance the competitiveness of our solutions comprehensively, in alignment with the Group directives. This initiative extends beyond sales-centric activities and encompasses all work done in Capgemini.

- **Evaluation of Suitability:** Assess the feasibility, impact and relevance of Gen AI applications across various functions and processes within the company to identify potential areas for improvement and innovation.
- **Adoption Strategy:** Develop a comprehensive strategy for adopting Gen AI technologies, encompassing pilot programs, evaluation frameworks, and scalability plans tailored to the diverse needs of different departments.

---

<sup>1</sup> "Subcontractors" here refer to individual service providers managed by Capgemini, and not to subcontractor companies to which we delegate part of the delivery – please check with your procurement team in case any questions arise.

- **Standardization and Consistency:** Adopt standardized Gen AI platforms and technologies endorsed by the Group to ensure consistency, security, and seamless integration across the organisation.
- **Cost-Benefit Analysis:** Conduct thorough cost-benefit analyses before implementing Gen AI solutions, considering factors such as licensing costs, cloud infrastructure requirements and costs, and environmental impact.
- **Change Management:** Develop robust change management plans to facilitate effective communication and monitor the progress of Gen AI adoption initiatives across the company.

By embracing generative AI as a company-wide initiative and encouraging exchange of experiences and best-practices across the organization, we can unlock its full potential to drive creation of value and productivity gains, enhance effectiveness, and foster innovation across all facets of our operations.

## HOW TO USE GEN AI

### *Gen AI Campus*

Capgemini University offers a dedicated **Gen AI Campus** focused on all aspects of generative AI to enhance your skills in related areas and explore trainings on those technologies. You can access the Gen AI Campus through this [link](#).

### *Use of Gen AI in delivery*

Possibility to leverage Gen AI in our delivery models is encouraged in Capgemini environment, always subject to applicable laws, Capgemini policies and contractual obligations with our clients. If a client expressly requests that the use of AI or Gen AI technology should be prohibited or restricted, the relevant commercial, legal, and technical impact assessment on our solution should be conducted.

### *Access to Gen AI technologies*

To access Gen AI approved technologies within Capgemini, please go on the [generative AI Talent page](#).

Technologies authorized at Group level are listed in the talent page. **All other technologies are strictly forbidden** (see detail on the talent page).

Note that any use of Gen AI technology should always abide by the Capgemini's usual Legal, Ethics, Cybersecurity and Data policies. Users should also refer to technology-specific guidelines released for each Gen AI technology approved at Group level.

Prompts used with approved technologies at group level will not be used to train provider or third-party models. Hence, users must only use approved Gen AI solutions.

Note that the use of some Gen AI technologies may be forbidden for certain use cases. For example, creative image generation is forbidden for most Gen AI technologies due to intellectual property issues. Other approved specific Gen AI tools shall be used for such use cases (please refer to technology-specific guidelines for more details).

For authorized tools, and unless otherwise specified in the technology-specific guidelines, prompts can include every type of data subject to (i) applicable laws, (ii) Capgemini policies and (iii) contractual obligations with our clients.

**The use of these technologies for businesses purposes shall never take place through private accounts.**

## RISKS, IMPLICATIONS & SUGGESTED MITIGATION

Inadequate handling of the below mentioned risks could result in severe reputational damage for Capgemini as well as legal and regulatory fines or sanctions. Users must exercise judgment in addition to considering local policies and regulations when applying generative AI within the Group.

The usage and regulatory implications of Gen AI methods and tools may vary significantly across our geographies, industries, use cases, context and capabilities and therefore must be evaluated. Remember that the risk profile may be different depending on who is consuming the output and what is the purpose of its use.

| RISKS, IMPLICATIONS & SUGGESTED MITIGATION |                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RISKS                                      | IMPLICATIONS                                                                                                                                                                                                                                                                                    | MITIGATION                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>OUTPUT CORRECTNESS, HALLUCINATION</b>   | Current models operate based on probability and have no inherent model of knowledge, ethics, or culture. Gen AI models have no guarantee at all about correctness of their outputs, and can produce confident sounding but factually incorrect output, a so-called "hallucination".             | Ensure Gen AI outputs are not presented to end-users who don't have the expertise to verify their accuracy. Ensure that we are transparent about our use of Gen AI so that consumers of the data can treat it with the appropriate degree of caution.<br>For Gen AI self-service, implement guardrails formally validated by the client or get a client formal validation that guardrails are not necessary. |
| <b>BIAS</b>                                | Gen AI models will reflect the biases present in their training data and can also be made to be deliberately coerced into producing biased outputs. For example, this can result in social discrimination (against certain population groups based on gender, ethnicity), or in product biases. | Ensure the development team and end-Customers of the Gen AI outputs are aware of the potential for bias. Implement training program for development teams and clients' teams and/or that suitable procedures are in place to ensure awareness of the bias risk.                                                                                                                                              |
| <b>INHERITED RISK</b>                      | Building a solution or system leveraging foundational models or Gen AI tools means that downstream systems inherit unknown risks from that Gen AI-based solution or system.                                                                                                                     | Ensure that any Gen AI-based solution / system is architected in a way to detect, intercept, and protect or with guardrails against troublesome outputs emerging from the Gen AI solution / system.                                                                                                                                                                                                          |
| <b>SUSTAINABILITY</b>                      | Gen AI models can require a huge amount of energy both in their initial training and their operational use.                                                                                                                                                                                     | Where possible, use tools to estimate and calculate the energy and carbon impact of a Gen AI solution. Ensure that the extra environmental impact of a Gen AI solution can be justified over a non-Gen AI solution.<br>A broad spectrum of Gen AI solutions exists including smaller LLMs. Ensure you adopt a frugal approach and LLMs adapted to your use case.                                             |
| <b>OUTPUT SECURITY VULNERABILITIES</b>     | Gen AI models generate output based on patterns learning from data from the internet. Therefore, there is a possibility that the output may contain well-known vulnerabilities (weaknesses in the system that could be exploited by malicious actors).                                          | Even if the code generated with the support of Gen AI Software Engineering tools could be functionally correct, it could include security vulnerabilities. If you are using Gen AI for code generation, follow strict security test procedures (static and dynamic) and use automated vulnerability scanners if appropriate.                                                                                 |

| RISKS                                                   | IMPLICATIONS                                                                                                                                                                                                                                                                                                                                                                                                                   | MITIGATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UNAUTHORISED AND/OR UNLAWFUL USE OF PERSONAL DATA       | Gen AI relies by definition on a massive set of data including personal data which can trigger unfair discrimination, privacy breaches, and lack of transparency in automated decision-making processes.                                                                                                                                                                                                                       | Input personal data only where strictly necessary for the targeted purpose and ensure in particular that:<br>(i) the personal data input in customization training sets or in prompts are precise and circumscribed in terms of scope.<br>(ii) if using sensitive personal data (e.g., health data, biometric data, political opinion, religion, sexual orientation) as input or to customize a Gen AI model or tool, a data protection and cybersecurity assessment is performed with the support of the competent data protection officer (DPO) and cybersecurity officer (CISO).<br>(iii) only input personal data with accurate permissions.<br>(iv) you clearly define and document how Gen AI systems process data and make decisions. |
| DATA LEAK                                               | Gen AI models often partially or completely memorize their training data, which may include sensitive or confidential data. Fragments of this memorized data might then leak out either accidentally or with deliberate prompting by others in the future.                                                                                                                                                                     | Never input restricted, sensitive, or proprietary data into any system or service that is not under Capgemini's control or where Capgemini does not have appropriate technical and contractual safeguards in place to ensure the privacy and security of that data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| INTELLECTUAL PROPERTY                                   | Current foundational models are often trained on data which may be copyrighted or restricted by license. Gen AI models might regurgitate this copyrighted data faithfully.                                                                                                                                                                                                                                                     | Where the end use of Gen AI would be affected by the leak of restricted, proprietary, sensitive, or copyrighted data into the output, consider using models that have been more transparently trained or have explicit legal safeguards. Implement appropriate governance processes to detect and block any legally questionable output.                                                                                                                                                                                                                                                                                                                                                                                                     |
| UNAUTHORIZED ACCESS OR OVERSHARING OF CONFIDENTIAL DATA | It is important to be cautious when using Gen AI models with access to company data to avoid oversharing classified data. Unauthorized access and oversharing can occur when access permissions are not correctly defined, and Gen AI models generate output based on files it should not have access to (internally, with partners or from clients). This could result in the data breach of sensitive data on a large scale. | Ensure that data is accurately classified and appropriately assessed for potential risks in accordance with the existing Data Management and Classification policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
